

GMS Key Switch

Open your electric gates, activate your alarm, control your security shutters, switch on your heater, lights or other device

...with a single FREE mobile phone call or by sending a text message

Remote control via your mobile phone

When was the last time you went out without your mobile phone? If it's always with you, why not increase its uses to add more convenience to your life. GSM Key Switch allows your phone to do just that.

GSM Key Switch will activate an electrical device with a call from your mobile phone. This doesn't cost you anything, because GSM Key Switch doesn't answer the call, but responds to your unique Caller ID before rejecting it. This makes it both secure and idiot proof.

So, alarms, driveway gates, lights, heating, security shutters and more items of choice are now controllable from wherever you and your phone happen to be. You can authorize up to 250 mobile phones per unit, which means unlike key fobs, access cards or separate remotes, you don't need one for each user, (with the associated cost, bother and risk of loss or having it stolen), but you can add OR remove users instantly, simply, securely and cost free.

With GSM Key Switch you get more than one way control. GSM Key Switch will monitor your burglar alarm, fire alarm or smoke alarm, texting you if it goes off, or progressively calling you and up to 7 other people. A truly intelligent addition to your home or business.

Technical Specifications

- Authorize up to 250 mobile phones to work with GSM Key Switch. To add new users - just add their mobile number onto the SIM.
No key fob or proximity card costs means significant savings
- Connect up to 2 electrical devices
- Three GSM Key Switch user levels;
 - Level 1 - basic user
 - Level 2 - alarm access
 - Level 3 - administration of users and unit parameters for levels 1 and 2

- Mains powered, 12V adaptor included. 12V battery back-up with charger also available.
- Receive a phone call or text message alert when your alarm goes off (ability to call up to 8 preprogrammed numbers progressively)
- 2 galvanically separated switching contacts (230V/ 5A)
- Setting of all parameters via PC through RS232 port. All parameters can be programmed directly on SIM by mobile phone or remotely by SMS
- 1 switching contact control by ringing only from authorized number (contact closed for pre-programmed fix time)
- Checking of credit level. Sending of SMS coming from operator to pre-programmed number.
- Dimensions: W 145 x H 75 x D 30mm

Inputs

Inputs 1 and 2 can monitor the state of an electrical circuit. When the circuit's state changes, the GSM Key Switch will send an SMS message to all of the nominated 'ALARM' contacts saved on its SIM card. It will also progressively dial each ALARM contact until one answers. The inputs can be used, for example, to monitor burglar alarms, fire alarms or smoke detectors.
